PROFESSIONAL SUMMARY

Computer Science and Engineering student with hands-on experience building scalable, containerized, and data-driven systems. Proficient in Python, C++, JavaScript, Docker, and Git, with a strong foundation in data structures, algorithms, and system design. Eager to contribute to agent infrastructure, container orchestration, and high-performance API development in fast-paced research and production environments.

EDUCATION

B.Tech in Computer Science and Engineering <i>KL University, Vaddeswaram, Andhra Pradesh</i> Currently Pursuing Expected Graduation: 2029	2025 – Present
Intermediate (MPC) <i>Sri Chaitanya Jr. College</i> 91.6%	2023 – 2025
10th Standard (SSC) <i>Sri Chaitanya High School</i> 91.1%	2022 – 2023

TECHNICAL SKILLS

Languages: Python, C++, JavaScript, Go (familiar), HTML5, CSS3
Data Analysis: pandas, NumPy, Microsoft Excel, statistical methods & data interpretation
AI/ML: PyTorch, TensorFlow, Hugging Face Transformers (learning), LLM fine-tuning & optimization, NLP, Deep Learning
Inference & Agent Frameworks: vLLM, Triton, TorchServe (familiar), Agentic AI & agent frameworks
Infrastructure & DevOps: Docker, AWS, Git, GitHub, Distributed Systems, Containerization, Linux
Core Competencies: Data Structures & Algorithms, OOP, System Design, FastAPI (familiar), gRPC (familiar)

PROJECTS

- Warehouse Inventory Handling System** | github.com/nivas4506
- Engineered a high-performance, containerized stock tracking system using advanced data structures (hash maps, trees) achieving $O(\log n)$ lookup across 10,000+ inventory records — demonstrating scalable system design principles applicable to agent execution environments.
 - Built automated alerting pipelines and analytics dashboards; designed for modularity to support future distributed deployments.
- Student Grievance Redressal System** | github.com/nivas4506
- Developed a full-stack platform with RESTful API endpoints and role-based access control, mirroring production-grade API design patterns used in agent infrastructure (akin to FastAPI/gRPC service interfaces).
 - Deployed using Docker for environment consistency; structured with MVC architecture to decouple service logic and enable scalability.
- LIQUID-MORPHISM – UI/UX Design Project** | github.com/nivas4506
- Built a modular component library with CSS3 and JavaScript, emphasizing performance optimization and cross-environment compatibility — skills transferable to building reliable agent-facing interfaces.

ADDITIONAL INFORMATION

- Actively exploring AI agent systems, container orchestration (Docker, Kubernetes concepts), and distributed infrastructure. Open to research internships and SWE roles in AI infrastructure and production systems.
